

Intelligent Trucking Solution releases Version 1.5, adding several new features along with significant improvements throughout the system to improve aggregate trucking efficiency.

Intelligent Trucking Solution's latest release has a multitude of changes and new features, including tabbed windows, new reports, new and improved back-up options, and much more.

Oxford, Michigan, Monday, June 27, 2005– Intelligent Trucking Solution released Version 1.5 with many new and improved features including payment reminders, tabbed windows, improved remote backup, new reports and more.

The tabbed windows feature allows users to do more multi-tasking; something that was limited in previous versions. This feature allows the user to have an almost unlimited number of tasks open at one time, making it easy to switch back-and-forth between different bids, tickets and invoices.

Version 1.5 also introduces a reminder option. This new feature allows a company a quick way to see which customers are late with their payments by automatically displaying past-due invoices.

“While working with our customers, it became evident that they needed to do more than one thing at a time.” said senior project manager John Zupancic. “We thought to ourselves ‘What aggregate trucking business can afford to have one item open at a time’, so we engineered the tabbed windows feature to permit the user to work on multiple tasks at once.”

The new version also has an improved remote backup option. “We simplified the backup procedure the users.” said senior programmer Josh Mouch. “Now all the client needs to do is setup a time to run the backup and our software takes care of the rest.”

You can visit our website (www.truckingsolution.com) where you can also watch several tutorial viewlets to learn more about ITS and you can download the fully functioning demo.
